Full stack developer for customer facing website (req79330)

Task statement

Create a simple "contact list" web application that allows:
- Listing people (name and photo)
- Searching by name
- Paging

Initial list should be one-time populated with people.csv attached. Contact addition/removal/edit is out of scope of this task.

Technical clarification

- Spring Boot
- Any build system
- Consider it as an enterprise-grade application (it will stay there for years, will be extended and maintained)
- As a result it should be DB-ready, meaning it should be little-to-zero effort to make this implementation use some enterprise DB (e.g. Oracle)
- For frontend you can use any technology
- Do not care about page design

Expected outcome

A repository at your GitHub account/local KN Git from where you can clone and run the web app with little-to-zero efforts.
